Z1 UNION-ANCHOR ANALYSIS

Evidence Record: Shared DFT Anchors

A projected saving, and what happened when we ran it. A frozen, artifact-backed analysis of 29 analyzable diffusion paths compares four separately evaluated sparse-anchor sets with their shared union.

01 / EXECUTIVE SUMMARY

What the evidence supports

Four model guides nominate sparse images on the same diffusion paths. Deduplicating identical within-path image indices reduces the locked projected reference-evaluation count from 558 to 154. The baseline is four separate runs.

- **Finding.** 72.4% fewer DFT evaluations, projected. The frozen separate-model accounting contains 558 projected DFT evaluations; the shared union contains 154. The baseline is four separate runs.
- **Ceiling.** The paths have 5–7 images, 167 in all, and the union covers 154 of them; deduplication alone caps the saving at 73.1%.
- **Exclusion.** One panel path lacks a converged prediction profile in all four artifacts and is excluded rather than imputed.
- **Boundary.** The result is prediction-side accounting, not an executed-DFT, accuracy, cost, or universal-transfer claim.
- **Realized pilot.** In July 2026 the preregistered 40 meV gate against published VASP barriers failed (path 7: 118.8 meV). A same-engine check adopted after that failure passed (0.0–6.8 meV) with every image evaluated: Open (same-engine only). Error against the published references: 693.0–705.7 meV.

EVIDENCE VERDICT

Supported as projected accounting only; not an accuracy result.

The committed JSON record, input SHA-256 digests, analysis script, and separately locked figure support the 558-to-154 comparison on 29 analyzable paths. Missing model–path profiles remain explicit and no realized campaign denominator is substituted. The realized pilot did not show accuracy against published references.

Reader orientation

This record presents the locked figure and table first, then the selection rule, exclusions, published literature, and audit trail. The full account of the pilot is “What happened when we ran it” on the canonical article.

02 / KEY FIGURES

The claim, then the mechanism

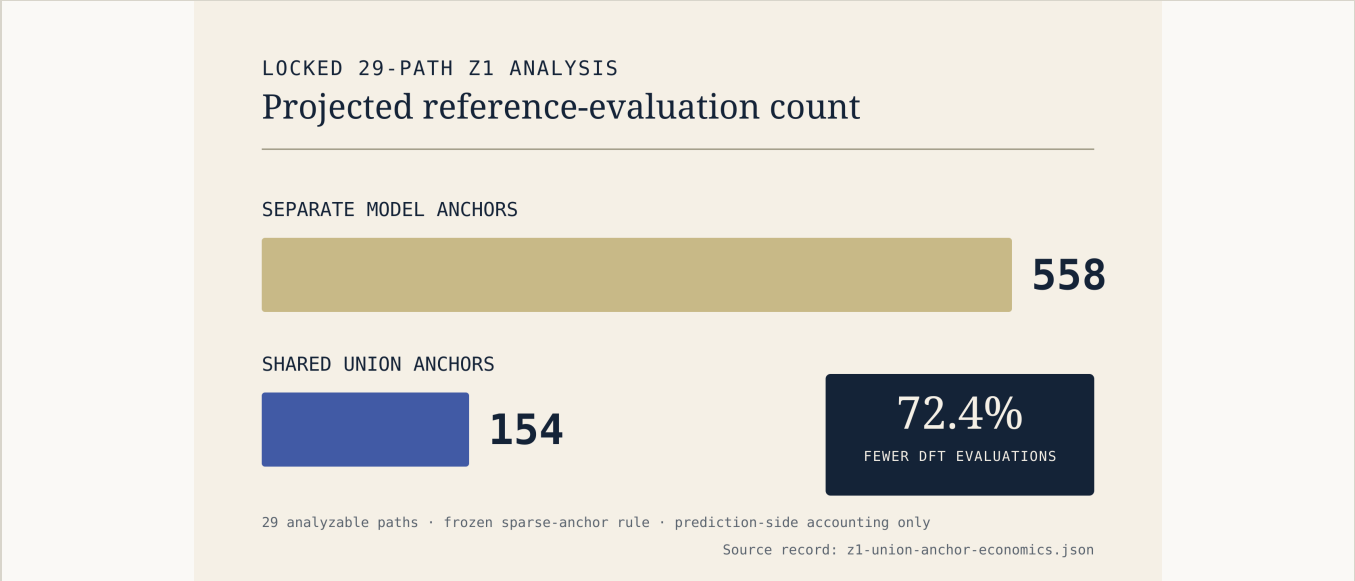

Figure 1. Frozen evaluation-count comparison on the 29 analyzable Z1 paths. The bars report the separate-model anchor count and the deduplicated within-path union count.

VERSIONING

LS-PP-2026-006 version 1.1.0, 2026-11-12 (version 1.0.0: 2026-08-03). Figure input and generated PDF checksums are in the evidence-record manifests.

KNOWN LIMITATIONS

One locked panel, four recorded universal interatomic-potential guides, one sparse-anchor rule, prediction-side accounting only. No accuracy, realized execution, dollar, wall-time, energy, emissions, or transfer claim is made.

Methodology note

Recorded predicted image-energy profiles select sparse anchor indices under a frozen rule. The analysis compares the sum of available model-specific sets with the cardinality of their within-path union and runs no new DFT.

Builds run entirely from repository assets. No runtime network requests, remote fonts, analytics, animation, or hidden interactive state are permitted in the PDF path.
